QA Automation Engineer (Web Consumer Apps) - Technical Test

Thank you for taking the time to do our technical test. The purpose of the exercise is to assess your technical ability in producing functional tests written in Ruby (Cucumber).

What you need to do

We have included an example test scenario for which we would like you to write the step definitions. Please also add a couple more scenarios, with corresponding step definitions, which you feel would enhance the test coverage of the site.

Set-up and running instructions

- You will need to install Ruby 1.9.x or newer.
- To make sure you have all the required dependencies, you will need to run "**bundle install**" from the root directory.
- To run the tests -> "**bundle exec rake**"

Submitting your test

In order to avoid bounced emails (some ISP's appear to be blocking emails with candidates' test result attachments) we would like you to submit your results by uploading the relevant zip file to a shared Google Drive folder. In order to supply you with the URL for this folder please send an email to tech.recruitment@just-eat.com stating your Google email address. (Alternatively, you can let your agent know your Google address.) If you don't already have a Google email address, please obtain one so that you can be given access to the JUST EAT test results folder.

Please make this a single zip file named {yourname}-{role-applied-for}.zip comprising <u>one</u> folder containing the entire technical test; that is, all existing files & folders plus any new ones you create as part of your solution.
